The New Standard-A New Era

A Guide to Effective Air Cleaning for the Home and Office

Is there a cause for concern over Indoor Air Quality ?

Over the past several years, a growing body of scientific evidence has indicated that the air within our homes and offices is more seriously polluted than the outdoor air in even the most industrialized city.

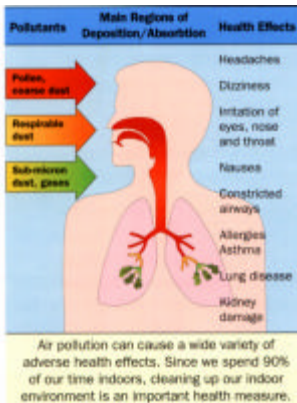

Since we spend over 90% of our time indoors, the risk to our health due to exposure to indoor air pollutants may be seen as considerable.

What Pollutants are of Concern in Indoor Air ?

Airborne pollutants take many forms, but they can be divided into two groups : Particles and Gaseous Pollutants.

Particles : are very small solid or liquid substances that are light enough to float suspended in air.

Gaseous Pollutants : include organic compounds and combustion gases, typically cigarette smoke, cleaning solutions etc.

Affects on the body as a result of poor Air Quality

Positive Action—Not Fear

Step 1—prevent circulation of contaminants at their source.

Your environment is unique—Indoor Air Quality depends upon humidity, the age of the building, the type of heating, choice of furnishing, the presence of pets or smokers and so forth.

Balanced management is the constructive way to healthy living with awareness and common sense your best guides.

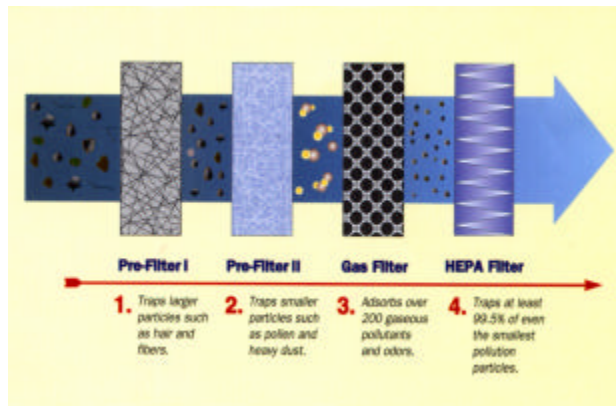

Step 2—After controlling the sources, take aggressive action to remove indoor air pollution from your environment.

Real preventative health means going after offensive allergens and chemicals and positively eliminating them.

Air filtration traps particles and gases leaving your air purified of offensive substances.

You should be aware that the only air cleaning system accepted by the medical and scientific communities is true medical HEPA medium for particulates and the combination of activated carbon and natural zeolite for gases.

With the highest standards of both HEPA and carbon/zeolite filtration, the CE-AIR Cleaners are your most powerful weapon against Indoor Air Pollution available on the market today.

Stages of Filtration—providing the very best available today

INSIDE YOUR AIR CLEANER :

The standard unit is fitted with a super-quiet permanent split capacitor motor.

Air enters 360 degrees from the surrounding room

Behind the steel outer grille lies the fibrous PERMAFIL pre filter, which traps large airborne particles.

The air then passes into the filter drum, passing firstly through packed carbon and zeolite, removing gases and odours, then through 80 square feet of pleated true medical HEPA medium which removes sub-micron particulates, which are the contaminants most injurious to health.

Pure clean air is finally expelled by the centrifugal fan in one direction from the louvred top deck.

This one directional air flow from the unit avoids contaminant laden floor areas and allows the air flow to be directed at will.

PEACE OF MIND :

Manufactured only from quality components and with its extended warranty and offer of the very best in filtration technology available today—you are assured not only of the cleanest and purest air available, but can be happy that you have a friend you can rely on to protect you, your family, friends and colleagues for many years to come.
